

Low fidelity prototype:

- I chose to list a column of items in the shopping cart next to the detailed information
- Users can edit their items in the cart while viewing the information, so they can recognize rather than recall.
- Users can also remove the item from cart or add the item to their wish list
- Order summary is right next to information so that users can check the total cost at anytime instead of having to scrolling to the bottom of the page.
- I designed the interface this way to give users more flexibility and efficient shopping experience.

High fidelity prototype:

-Based on the low fidelity prototype, I increased the size of "Total" and made it bold. This design can attract users' attention and lead them to focus more on the more important information.
